

ABSTRACT OF THE DISCLOSURE

A fastener, for use with a sheet-shaped member, comprises a tubular shank, a plurality of holding pieces extending outward from a first end of the shank, a flange extending outward from a second end of the shank, and a plurality of stud-engagement pawls extending into the interior of the shank. The shank has a length less than that of a stem of a stud fixed to a mounting member with which the fastener is to be engaged. When the stud is fully inserted into the tubular shank, the sheet-shaped member is fastened to the stud and the stud stem protrudes from a surface of the sheet-shaped member. The protruding portion of the stem allows an auxiliary member to be mounted thereto.
